

Chapter 6 Homework Solutions

6.1 $m = 0.112 \text{ mol Glu/kg H}_2\text{O}$ $M(\text{Glu}) = 180 \text{ g/mol}$

$$mass = 250 \text{ g H}_2\text{O} \cdot \frac{0.112 \text{ mol Glu}}{1000 \text{ g H}_2\text{O}} = 0.028 \text{ mol Glu} \cdot \frac{180 \text{ g Glu}}{1 \text{ mol Glu}} = 5.04 \text{ g Glu}$$

6.2 $M(\text{H}_2\text{O}) = 18 \text{ g/mol}$ $mass(\text{H}_2\text{O}) = 1.0 \text{ kg} = 1000 \text{ g}$

$$n_{\text{Ala}} = 0.134 \text{ mol}$$

$$n_{\text{H}_2\text{O}} = 1000 \text{ g} \times 1 \text{ mol}/18 \text{ g} = 55.6 \text{ mol}$$

$$X_{\text{Ala}} = \frac{n_{\text{Ala}}}{n_{\text{Ala}} + n_{\text{H}_2\text{O}}} = \frac{0.134 \text{ mol}}{0.134 \text{ mol} + 55.6 \text{ mol}} = 2.40 \times 10^{-3}$$

6.3 $M(\text{Suc}) = 342 \text{ g/mol}$ $M(\text{H}_2\text{O}) = 18 \text{ g/mol}$

$$mass(\text{H}_2\text{O}) = 100 \text{ g} = 0.10 \text{ kg}$$

$$n_{\text{H}_2\text{O}} = 100 \text{ g} \times 1 \text{ mol}/18 \text{ g} = 5.56 \text{ mol}$$

$$X_{\text{Suc}} = 0.124 = \frac{n_{\text{Suc}}}{n_{\text{Suc}} + 5.56} \rightarrow 0.124n_{\text{Suc}} + (0.124)(5.56) = n_{\text{Suc}}$$

$$0.876n_{\text{Suc}} = 0.689 \rightarrow n_{\text{Suc}} = 0.787 \text{ mol}$$

$$mass(\text{Suc}) = 0.787 \text{ mol} \times 342 \text{ g/mol} = 269 \text{ g}$$

6.4 Assume that $150 \text{ cm}^3 \text{ H}_2\text{O} = 150 \text{ g H}_2\text{O} = 0.15 \text{ kg H}_2\text{O}$ because $d(\text{H}_2\text{O}) = 1.00 \text{ g/cm}^3$

$$n_{\text{Suc}} = 7.5 \text{ g} \times 1 \text{ mol}/342 \text{ g} = 0.0219 \text{ mol}$$

$$m_{\text{Suc}} = \frac{0.0219 \text{ mol Suc}}{0.15 \text{ kg H}_2\text{O}} = 0.146 \text{ mol Suc / kg H}_2\text{O} = 0.145 \text{ m}$$

$$\Delta T_f = K_f m_{\text{Suc}} = (1.86 \text{ }^\circ\text{C/m})(0.146 \text{ m}) = 0.27 \text{ }^\circ\text{C} = T_f^\circ - T_f = 0 - T_f$$

Therefore, $T_f = -0.27 \text{ }^\circ\text{C}$

- 6.5** $K_f(\text{CCl}_4) = 30 \text{ K kg/mol} = 30 \text{ }^\circ\text{C/m}$ $\Delta T_f = -9.3 \text{ }^\circ\text{C} - (-14.7 \text{ }^\circ\text{C}) = 5.4 \text{ }^\circ\text{C} = 5.4 \text{ K}$
 $m_X = \Delta T/K_f = 5.4 \text{ }^\circ\text{C} / 30 \text{ }^\circ\text{C/m} = 0.18 \text{ m} = 0.18 \text{ mol/kg CCl}_4$
 $n_X = 0.18 \text{ mol / kg CCl}_4 \times 0.75 \text{ kg CCl}_4 = 0.135 \text{ mol}$
 $\text{mass}_X = 28 \text{ g (given in problem)}$

$$M_X = \frac{\text{mass}_X}{n_X} = \frac{28 \text{ g}}{0.135 \text{ mol}} = 207 \text{ g/mol}$$

- 6.6** $\Pi = [\text{Urea}]RT \rightarrow [\text{Urea}] = \frac{\Pi}{RT} = \frac{120 \text{ kPa}}{(8.314 \text{ kPa} \cdot \text{L/mol} \cdot \text{K})(300 \text{ K})} = 0.048 \text{ mol/L}$

In dilute aqueous solution, molality \approx Molarity.

Therefore, $m_{\text{Urea}} = 0.048 \text{ m}$.

$$\Delta T_f = K_f m_{\text{Urea}} = 1.86 \text{ }^\circ\text{C/m} \times 0.048 \text{ m} = 0.09 \text{ }^\circ\text{C} = T_f^\circ - T_f = 0 - T_f$$

Therefore, $T_f = -0.09 \text{ }^\circ\text{C}$

- 6.7** $n_{\text{Suc}} = 75 \text{ g} \times 1 \text{ mol/342 g} = 0.22 \text{ mol}$
 $n_{\text{H}_2\text{O}} = 140 \text{ g} \times 1 \text{ mol/18 g} = 7.78 \text{ mol}$

(a) $X_{\text{Suc}} = \frac{n_{\text{Suc}}}{n_{\text{Suc}} + n_{\text{H}_2\text{O}}} = \frac{0.22}{0.22 + 7.78} = 0.028$

(b) $m_{\text{Suc}} = \frac{n_{\text{Suc}}}{\text{mass H}_2\text{O}} = \frac{0.22 \text{ mol}}{0.14 \text{ kg}} = 1.57 \text{ mol/kg} = 1.57 \text{ m}$

(c) $\text{mass}(\text{tot}) = 75 + 140 = 215 \text{ g}$

$$V = \frac{\text{mass}}{\text{density}} = \frac{215 \text{ g}}{1.23 \text{ g/mL}} = 175 \text{ mL} = 0.175 \text{ L}$$

$$[\text{Suc}] = \frac{n_{\text{Suc}}}{V} = \frac{0.22 \text{ mol}}{0.175 \text{ L}} = 1.26 \text{ mol/L} = 1.26 \text{ M}$$

- 6.8** $c' = \frac{0.15 \text{ g}}{0.10 \text{ L}} = 1.5 \text{ g/L}$

$$\Pi = 2.00 \text{ torr} \times 1 \text{ kPa/7.50 torr} = 0.267 \text{ kPa}$$

$$M = \frac{c'RT}{\Pi} = \frac{(1.50 \text{ g/L})(8.314 \text{ kPa} \cdot \text{L/mol} \cdot \text{K})(298 \text{ K})}{0.267 \text{ kPa}} = 13,900 \text{ g/mol}$$

Alternate Solution on next page (prefer alternate)

6.8 Alternative Solution

1. Calculate n_{Lys} $\Pi = 2.00 \text{ torr} \times 1 \text{ kPa}/7.50 \text{ torr} = 0.267 \text{ kPa}$, $T = 298 \text{ K}$

$$[\text{Lys}] = \Pi/RT = (0.267 \text{ kPa})/(8.31 \text{ kPa}\cdot\text{L}/\text{mol}\cdot\text{K})(298 \text{ K}) = 1.078 \times 10^{-4} \text{ mol/L}$$

$$n_{\text{Lys}} = [\text{Lys}] \times V = 1.078 \times 10^{-4} \text{ mol/L} \times 0.10 \text{ L} = 1.078 \times 10^{-5} \text{ mol}$$

2. Calculate M_{Lys} $\text{mass}(\text{Lys}) = 0.15 \text{ g}$

$$M_{\text{Lys}} = \text{mass}(\text{Lys})/n(\text{Lys}) = 0.15 \text{ g}/1.078 \times 10^{-5} \text{ L} = 1.39 \times 10^4 \text{ g/mol} = 13,900 \text{ g/mol}$$

6.9 $n_{\text{Na}_3\text{PO}_4} = 15 \text{ g}/164 \text{ g/mol} = 0.0915 \text{ mol}$

$$m_{\text{Na}_3\text{PO}_4} = 0.0915 \text{ mol} / 0.12 \text{ kg} = 0.76 \text{ mol/kg} = 0.76 \text{ m}$$

$$[\text{Na}_3\text{PO}_4] = \frac{n}{V} = \frac{0.0915 \text{ mol}}{0.132 \text{ L}} = 0.69 \text{ mol/L} = 0.69 \text{ M}$$

(a) $\Delta T_b = iK_b m_{\text{Na}_3\text{PO}_4} = 4 \times 0.51 \text{ }^\circ\text{C}/\text{m} \times 0.76 \text{ m} = 1.55 \text{ }^\circ\text{C}$
Therefore, $T_b = 100 \text{ }^\circ\text{C} + 1.55 \text{ }^\circ\text{C} = 101.55 \text{ }^\circ\text{C}$

(b) $\Pi = i [\text{Na}_3\text{PO}_4]RT = 4 \times 0.69 \text{ mol/L} \times 8.314 \text{ kPa}\cdot\text{L}/\text{mol}\cdot\text{K} \times 313 \text{ K}$
 $= 7180 \text{ kPa} = 71.8 \text{ bar}$
